Bitter Apple, hanzal, bateekh

GENERAL

Origin : Mediterranean,

sub-tropical, tropical

Vigour : fast growing
Humidity : very arid, semi-

arid, semi-humid

Propagation: sowing and pricking out

Maintenance : low

CONDITIONS

Urban climate:resistantDessication:resistantStagnant water:vulnerableIrrigation:none

Salinity/ppm : low (1000 ppm)

Hardiness : 0°C

SHAPE

Type : perennial
Height : 0.3 m
Spread : 3 m
Foliage : deciduous

FLOWER

Colour : yellow Size : 2.5 cm Period : March - July

FRUIT

Type of fruit : berry
Fruit size : 7 cm
Toxicity : poisonous

Citrullus colocynthis, known in English as Bitter Apple and in Arabic as hanzal, is a fast growing, prostrate, trailing or climbing perennial herb with tendrils that can extend up to 3 metres. It occurs throughout northern and southern Africa, southwest Asia and the Arabian Peninsula, where it is widespread, especially in the Arriyadh region, owing to its hardiness in the summer. A more common relative of C. colocynthis is Citrullus lanatus, the watermelon. The leaves are triangular, grey-green and deeply lobed with three to seven lobes. The branches are hairy. The small, yellow flowers appear in summer. The fruit is about 7 cm in size, initially fleshy and a mottled green with yellow bands. Older fruits are yellow, and rattle if shaken. The fruit was used formerly as a digestive, and the taste is very bitter. Nowadays, its medicinal uses are limited, because it can damage the liver. Propagation is by seed. It grows on sandy soil, is moderately salt-tolerant, and for landscape purposes little maintenance is necessary once established. C. colocynthis will not tolerate frost, but recovers during summer. The Bitter Apple is very useful for open land as a coloniser and slope stabiliser. It can be also planted in extensive landscape schemes such as rock or steppe gardens, and as a groundcover.
